

BALING PRESS CART

5

ABSTRACT

The invention provides a cardboard baling press cart of the manual operated type,
10 used for baling loose cardboard. This baling press cart includes a two layer rack and a
movable baling ram which moves horizontally back and forth in-between the front and back
frame within the center space of the upper layer of the rack. The baling ram is moved by
two struts, which are hinge jointed together. The lower strut is hinge jointed to the lower
layer of the rack and the upper strut is attached to the bottom of the baling ram. A tension
15 spring is attached under the baling ram to provide resilience to relocate the baling ram.
